

WHAT TO EXPECT THE DAY OF THE PROCEDURE

- + The procedure will begin with application of local anesthesia to ensure your comfort. This can take up to 15–30 minutes.

- + During the procedure, a thin instrument, with the balloon, will be guided through your nasal passages to the treatment area.
- + After being positioned, the balloon will be gently inflated for five seconds and then deflated.
- + The balloon may be repositioned and the inflation repeated.

- + When dilation is complete, the instrument and balloon will be removed. A typical procedure takes approximately 1 hour.
- + Most people return to normal activity 24 hours after the procedure.¹
